

# On the importance of using appropriate spectral models to derive physical properties of galaxies

*Camilla Pacifici (Yonsei), Elisabete da Cunha (MPIA),  
Hans-Walter Rix (MPIA), Stephane Charlot (IAP), Sukyoung Yi (Yonsei)*

# Outline

---

- Spectral-energy-distribution (SED) fitting
- Observed sample
- Modeling approach - the behaviour of different spectral libraries
- Extracting the physical parameters
- Conclusions

# SED fitting

# SED fitting

# SED fitting

SED fitting relies on assumptions

star formation and metal enrichment histories

stellar population models

gas models

dust models

Statistical treatment of the result

# SED fitting

SED fitting relies on assumptions

star formation and metal enrichment histories

stellar population models

gas models

dust models

Statistical treatment of the result

build large library of “as realistic as possible”  
SEDs to estimate physical parameters from  
multi-wavelength observations

# Observed sample

---

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

to study the effects of different SED  
libraries when extracting the  
physical parameters

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

to study the effects of different SED  
libraries when extracting the  
physical parameters

9 broad bands: U, 4 ACS, 3 WFC3,  
IRAC 3.6 $\mu$ m

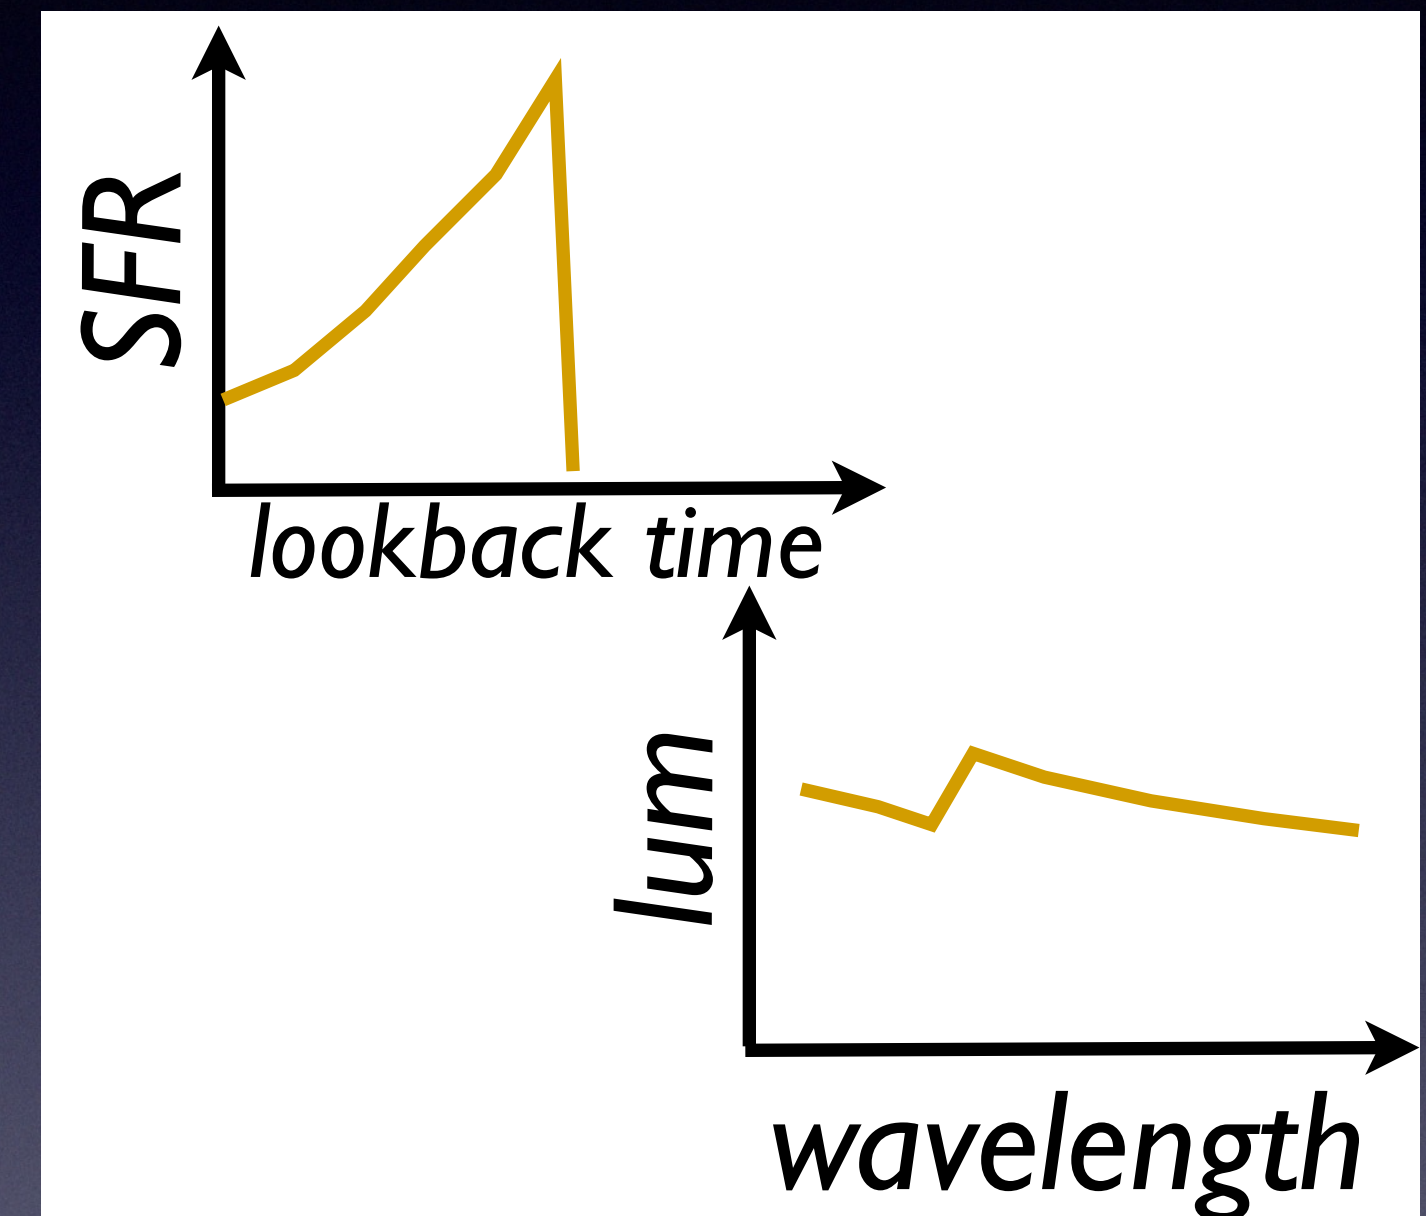

# Modeling approach

3 different spectral libraries - same statistical approach

## CLASSICAL

- exponentially declining SFHs, fixed metallicity
- stellar emission from the latest version of BC03
- simple dust attenuation

# Modeling approach

3 different spectral libraries - same statistical approach

## CLASSICAL

- exponentially declining SFHs, fixed metallicity
- stellar emission from the latest version of BC03
- simple dust attenuation

## PI2 without emission lines

- physically motivated SF and ME histories
- stellar emission from the latest version of BC03
- sophisticated dust attenuation

# Modeling approach

3 different spectral libraries - same statistical approach

## CLASSICAL

- exponentially declining SFHs, fixed metallicity
- stellar emission from the latest version of BC03
- simple dust attenuation

## PI2 without emission lines

- physically motivated SF and ME histories
- stellar emission from the latest version of BC03
- sophisticated dust attenuation

## PI2

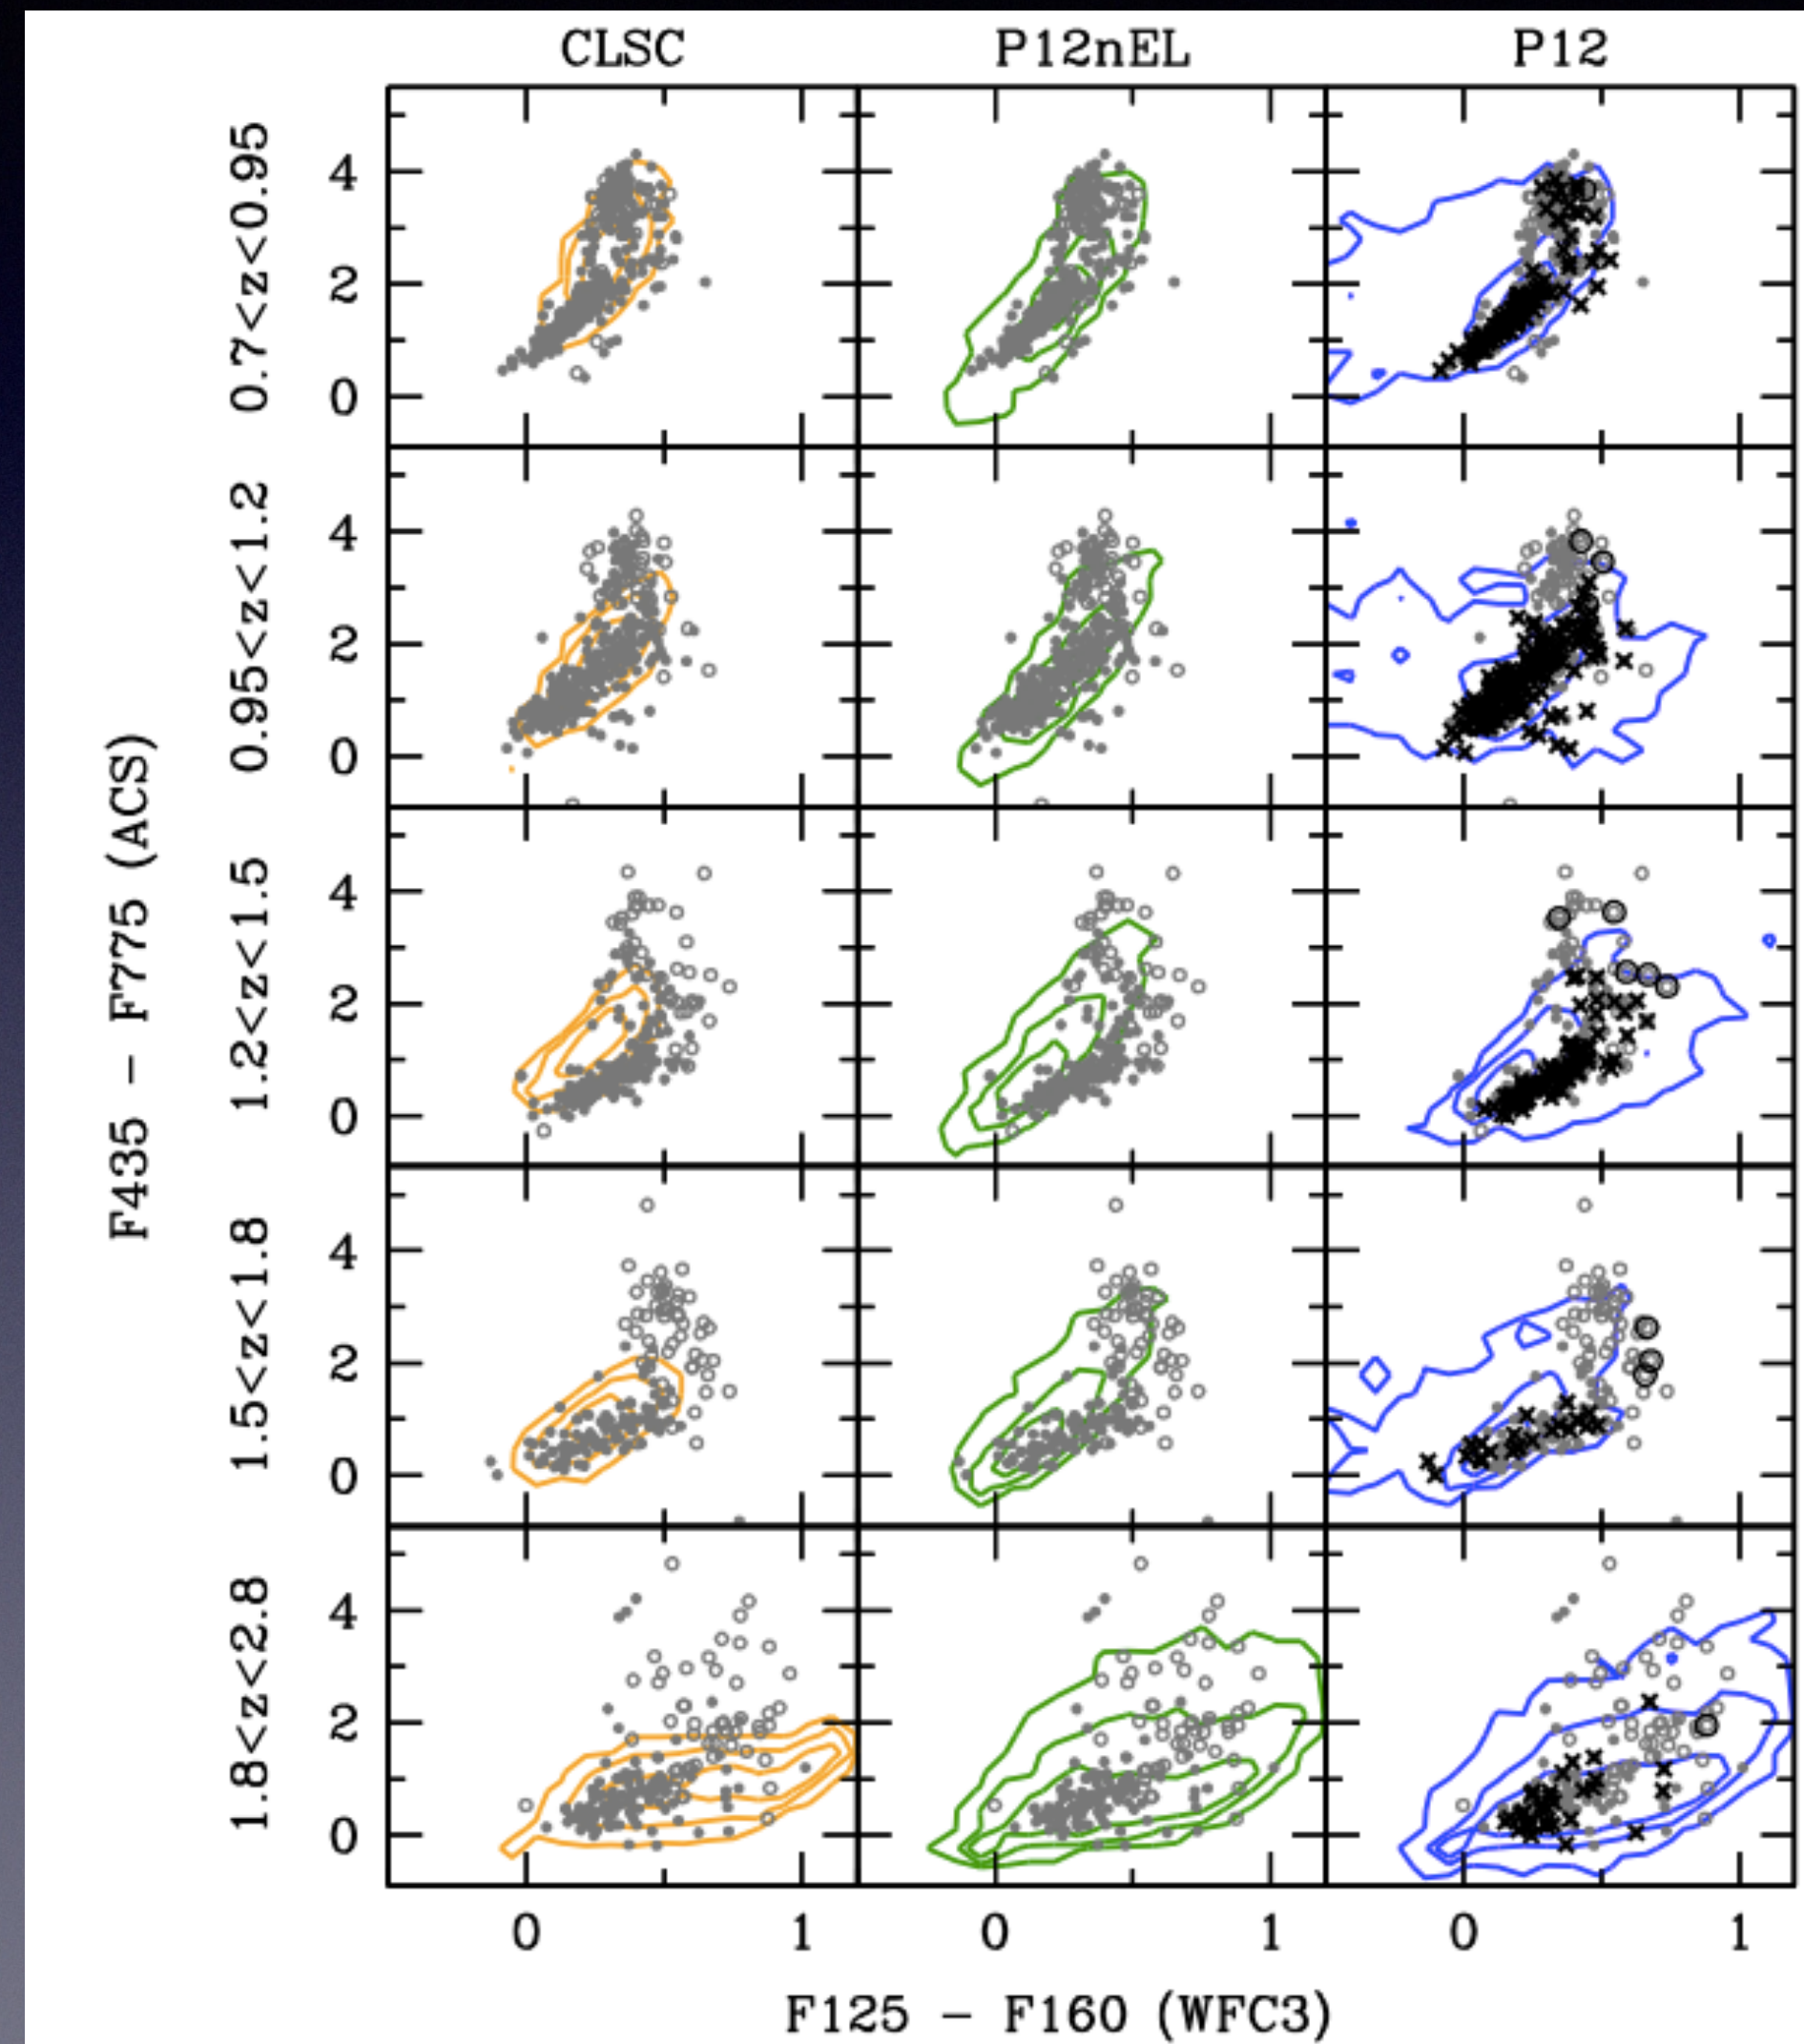

- physically motivated SF and ME histories
- stellar emission from the latest version of BC03
- nebular emission lines included
- sophisticated dust attenuation

# Modeling approach

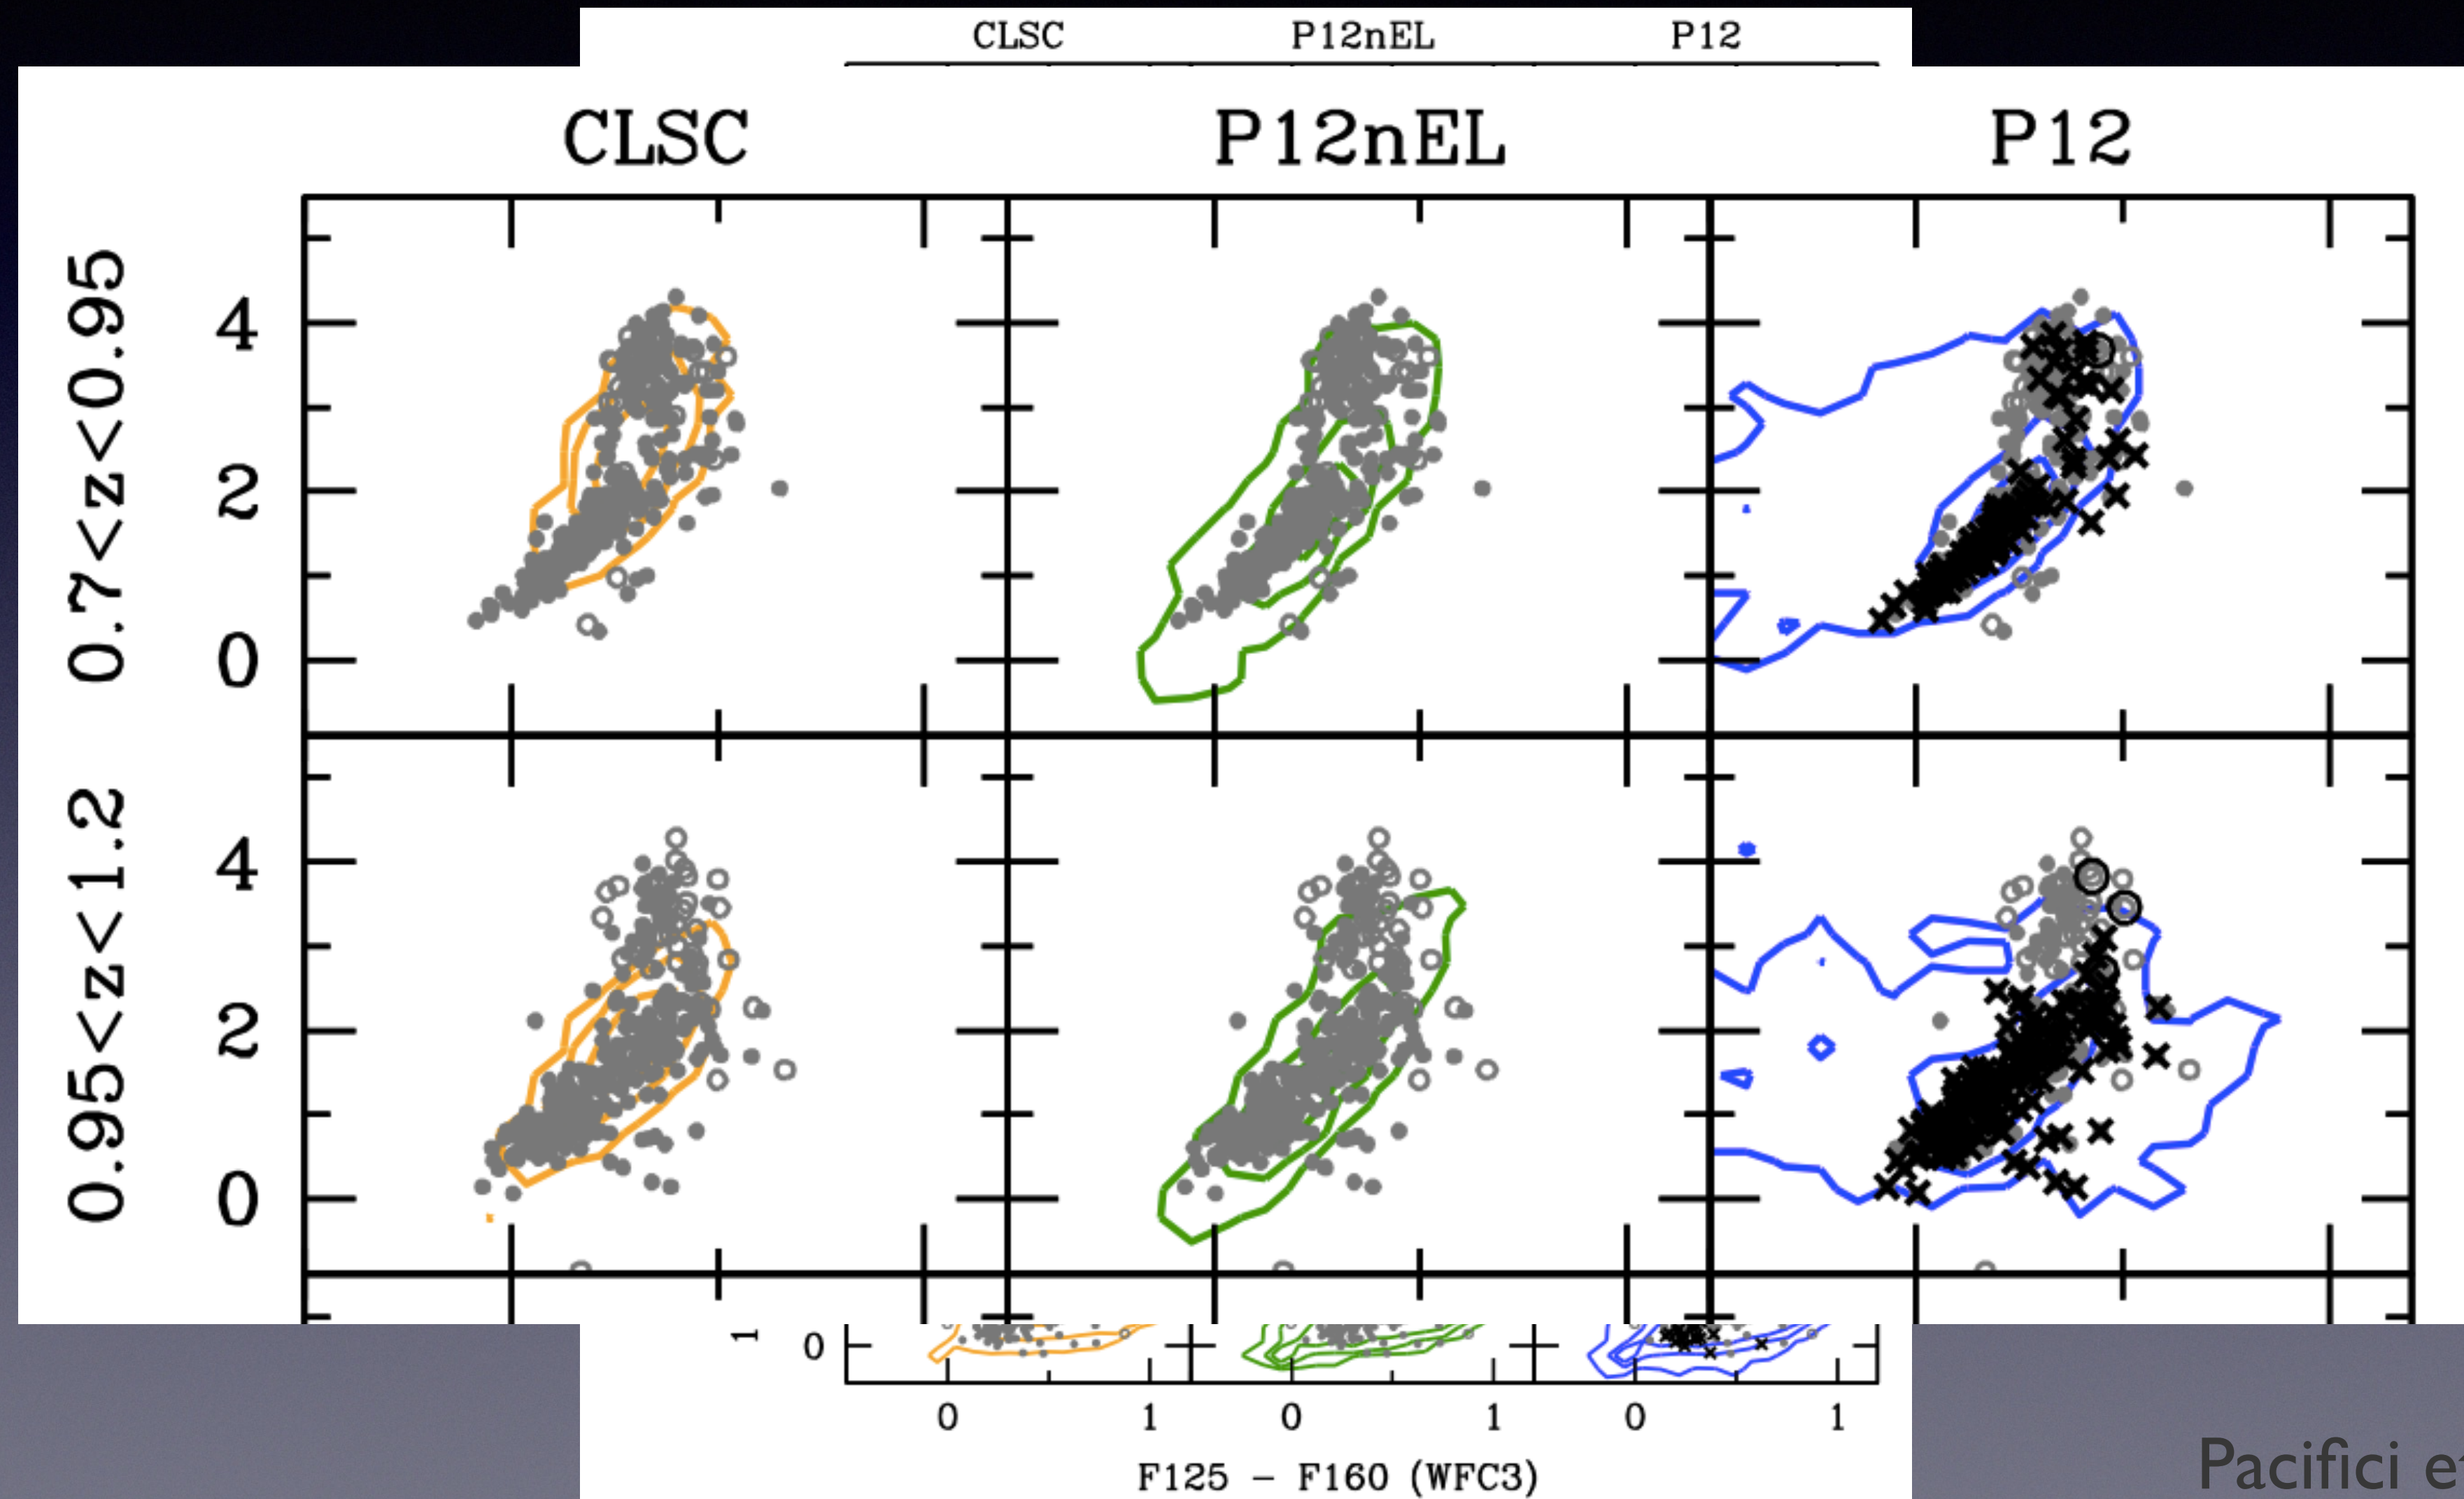

Convolve SEDs with the broad band filters and compare with observations

# Modeling approach

Convolve SEDs with the broad band filters and compare with observations

# Fitting procedure

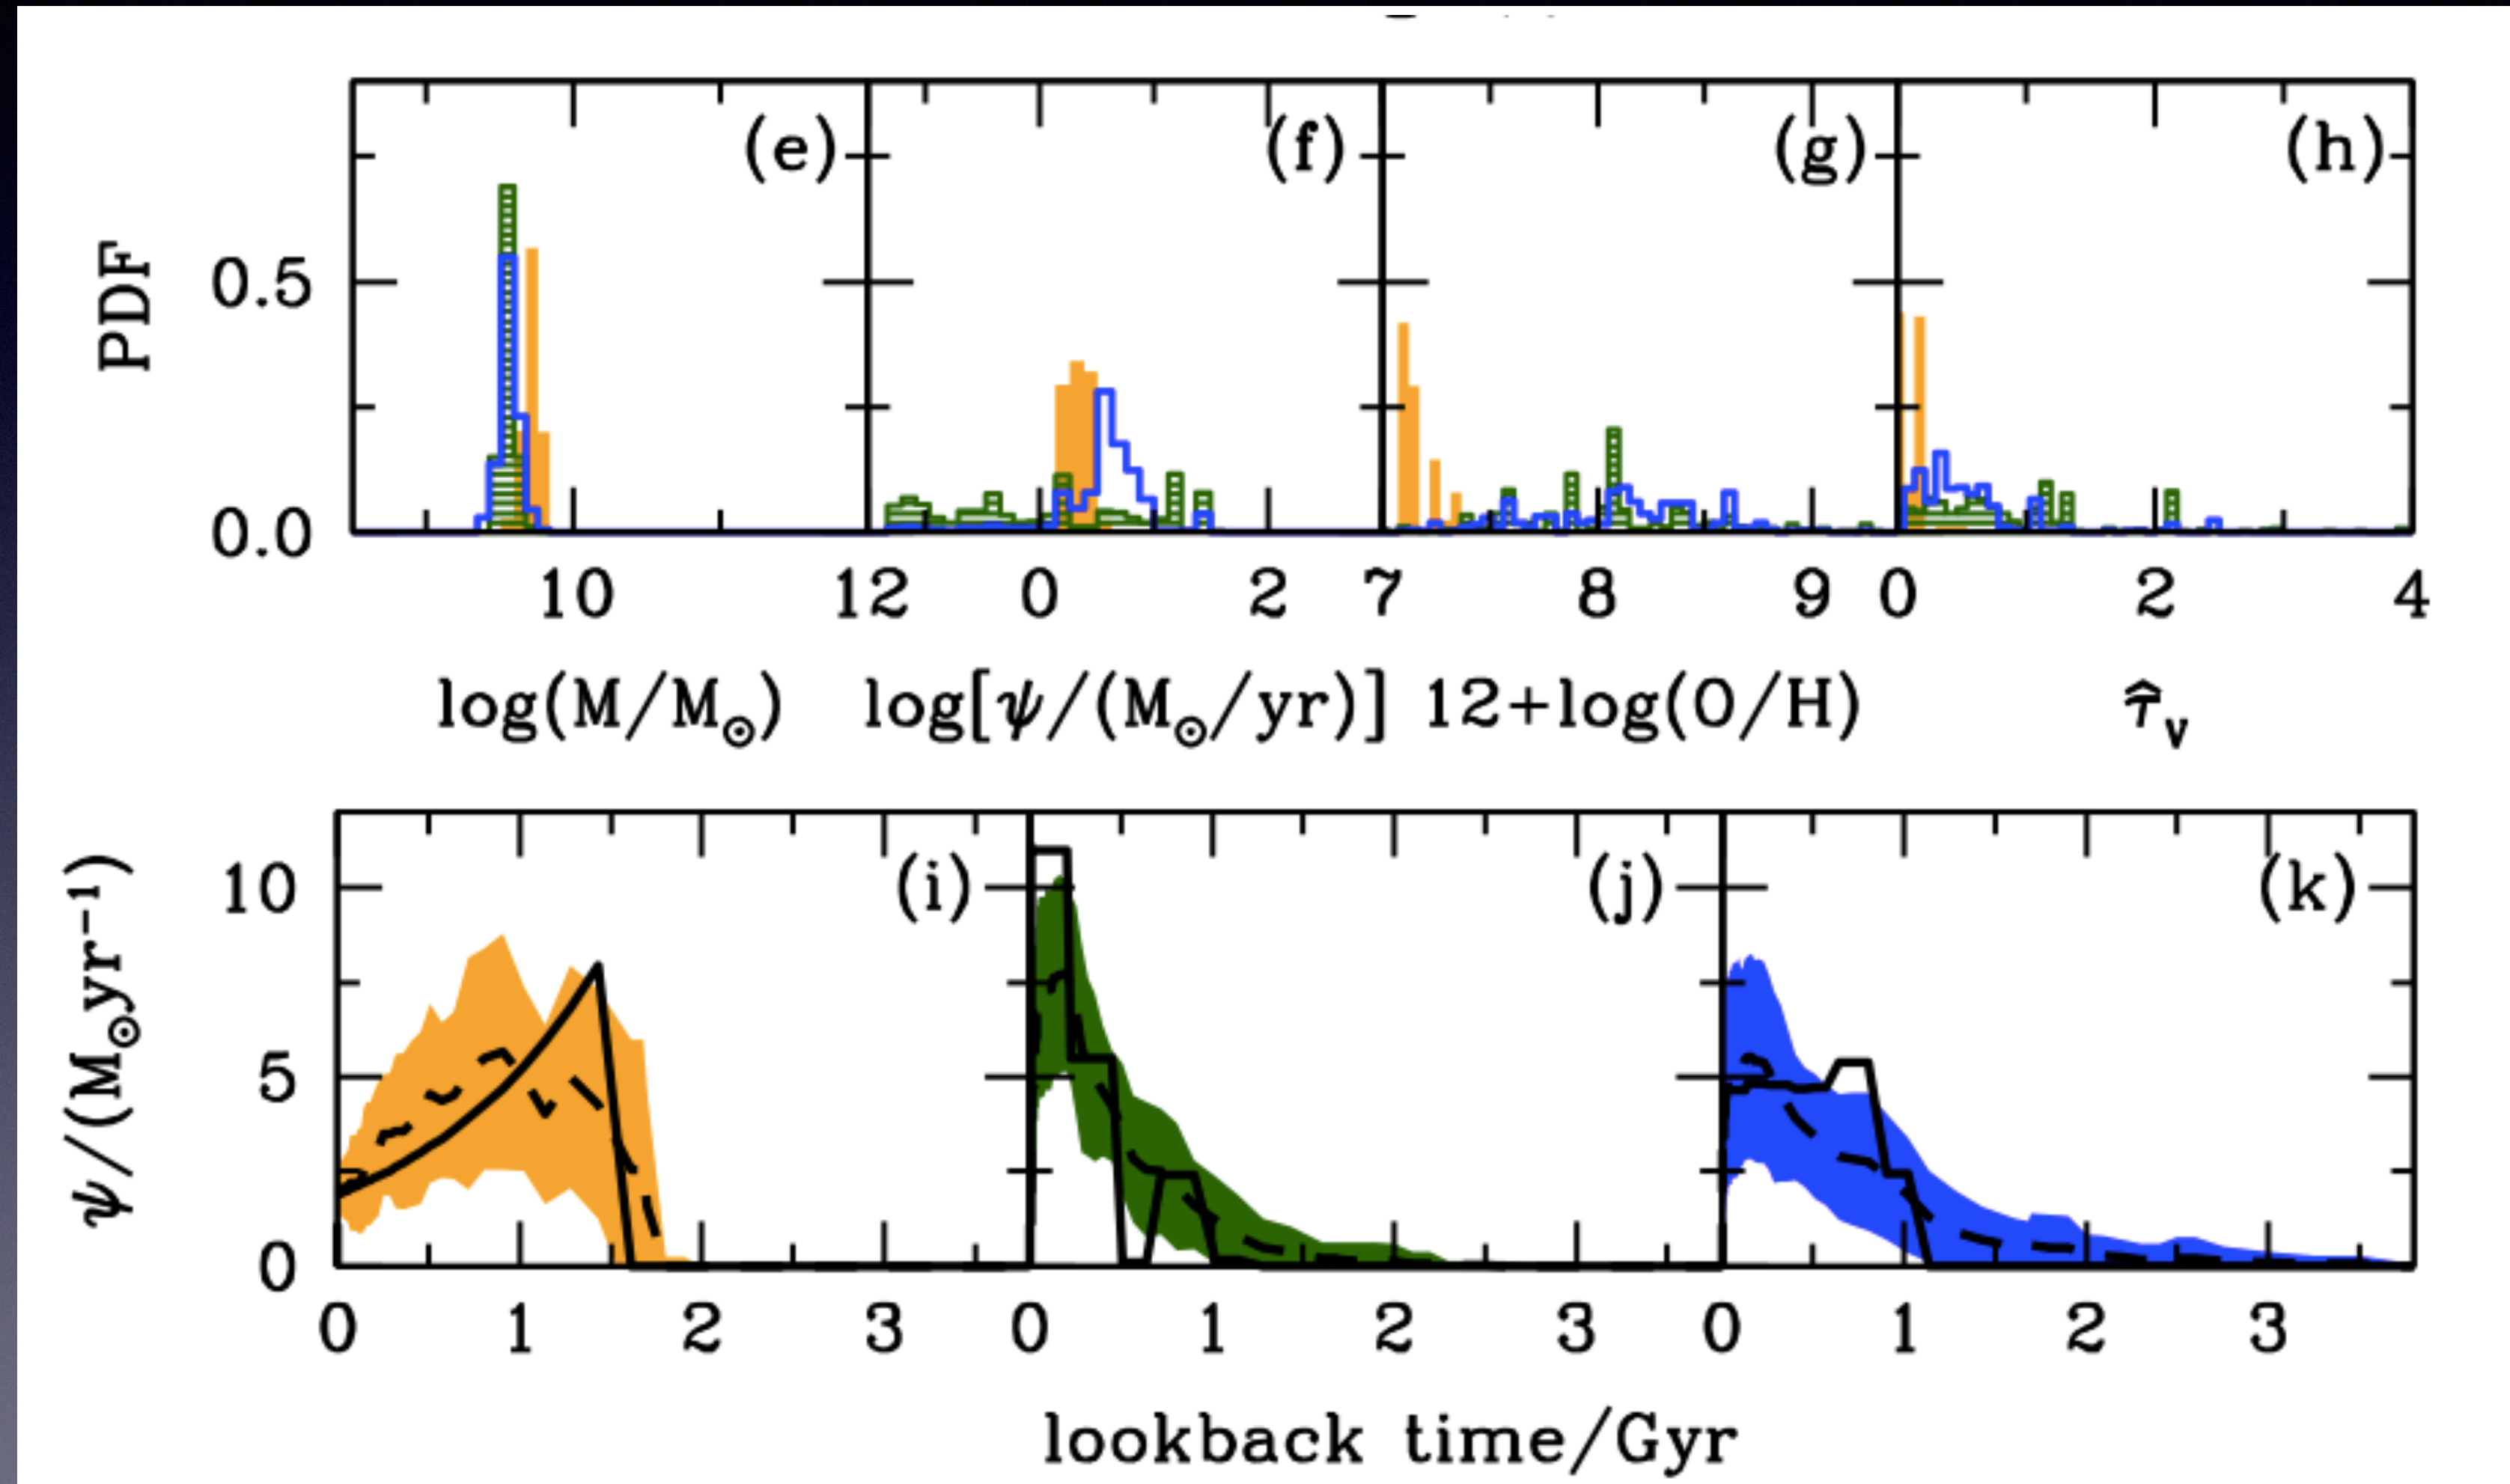

Photometric fit to 9 broad bands

# Fitting procedure

Photometric fit to 9 broad bands

# Extracting the physical parameters

The impact of the different libraries on the fits

# Take home messages

---

- SED fitting is a very powerful tool when the assumptions are under control
- It is important to make sure that the spectral models can reproduce the observations
- Uncertainties are useful if they are reliable
- Emission lines should not be forgotten

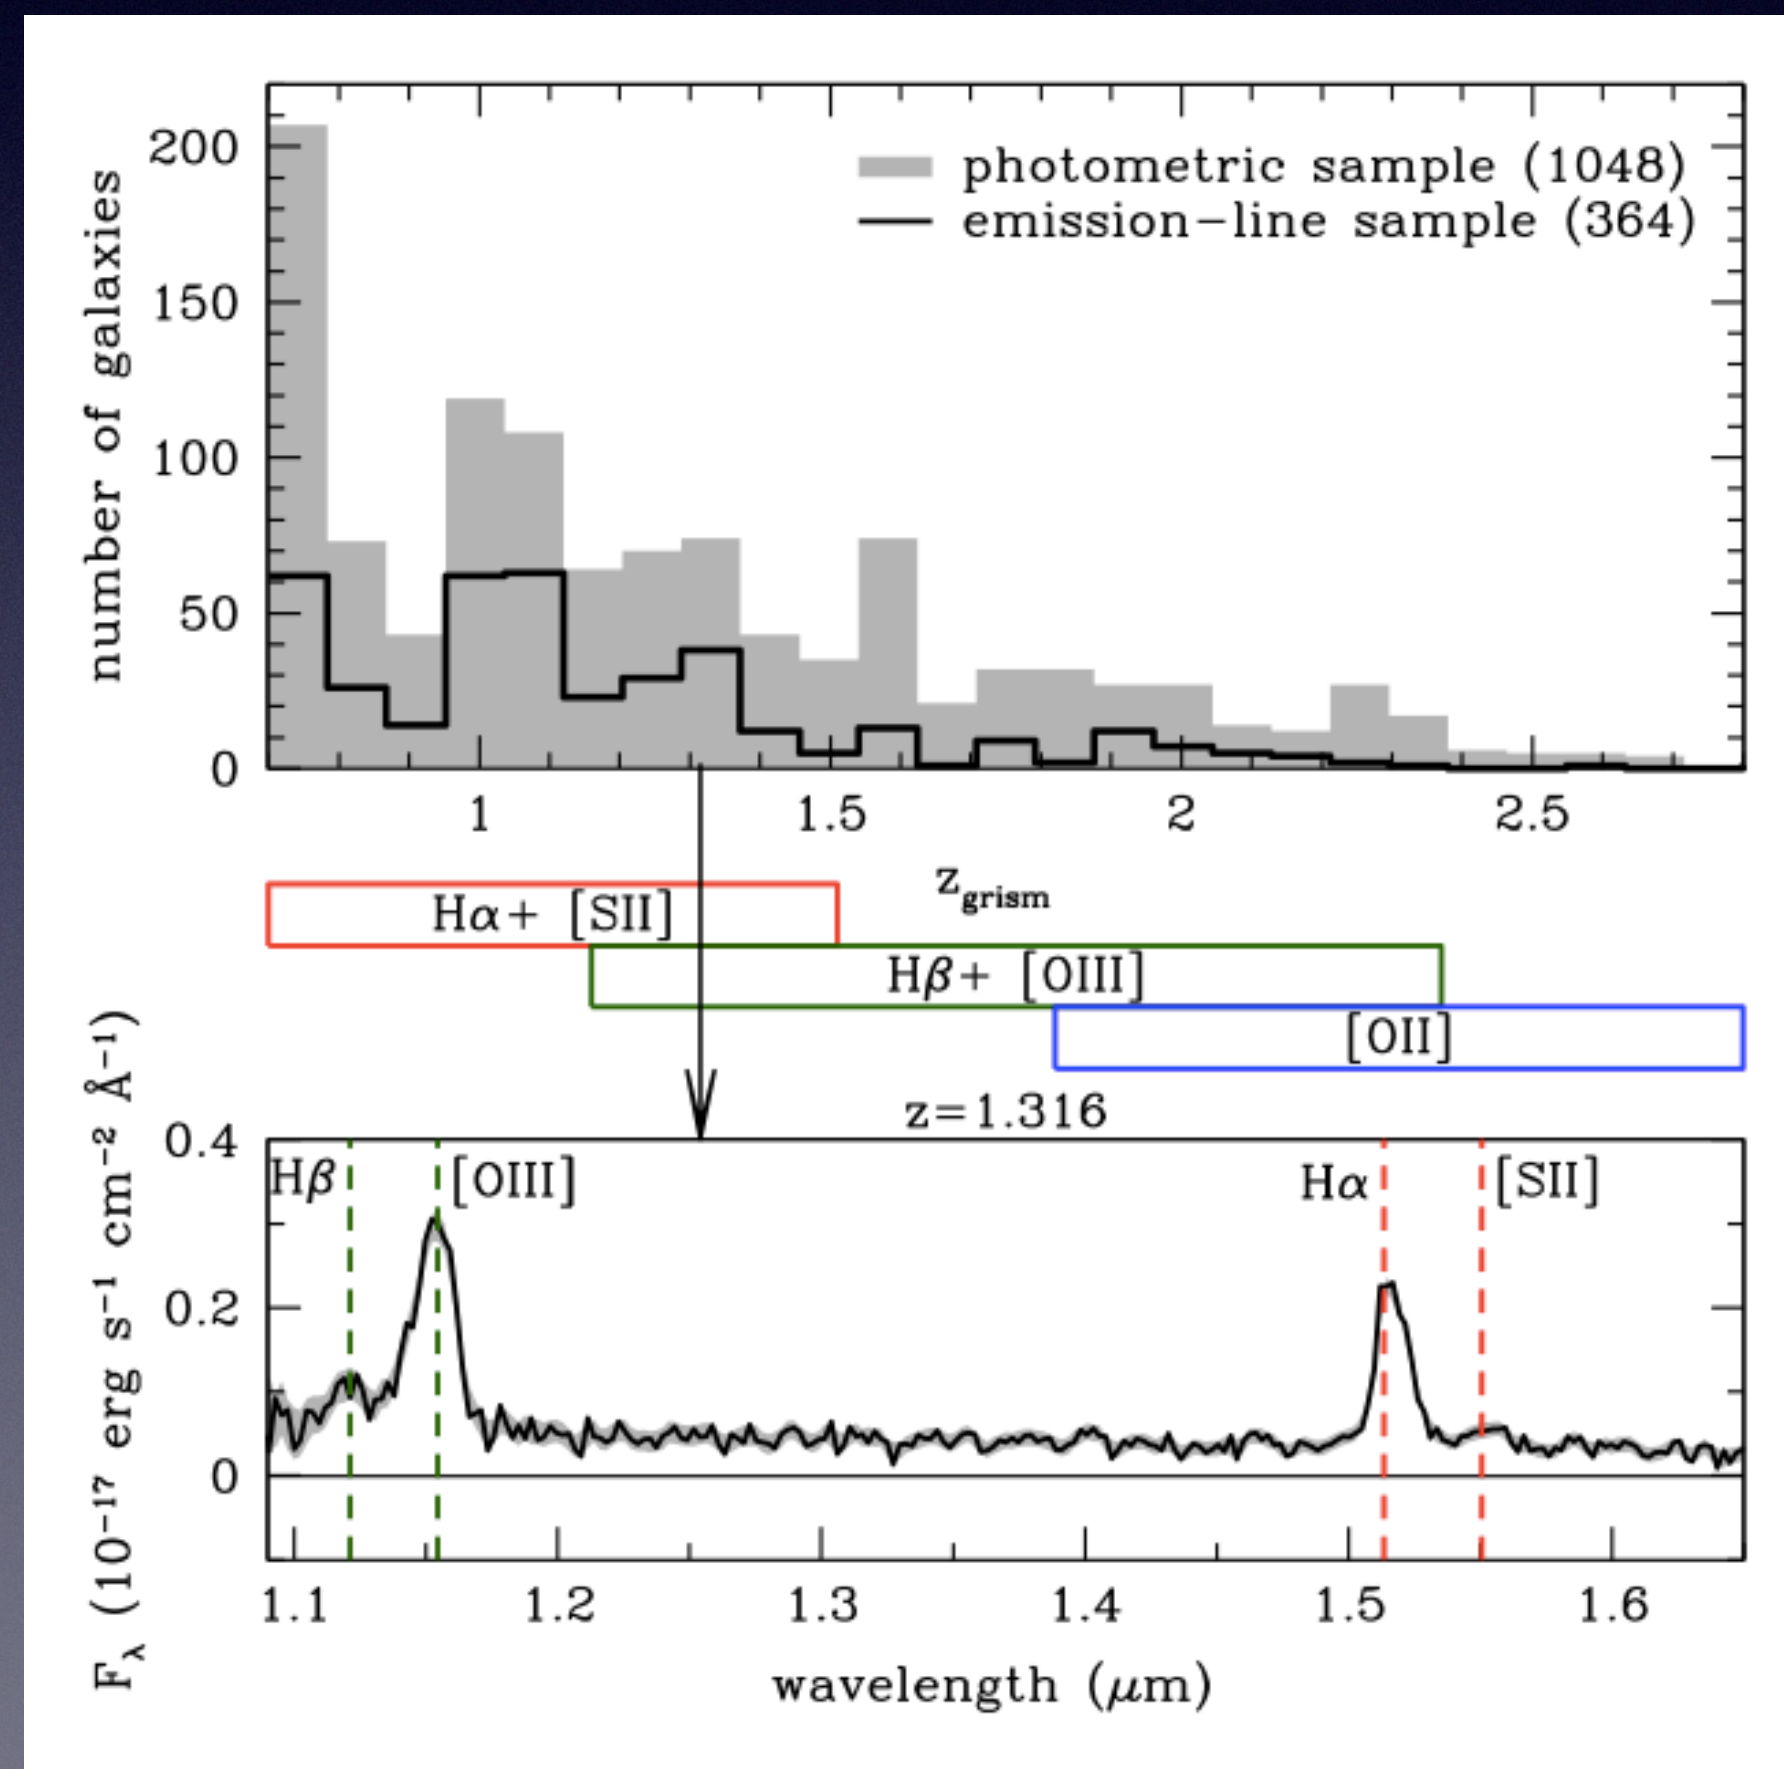

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

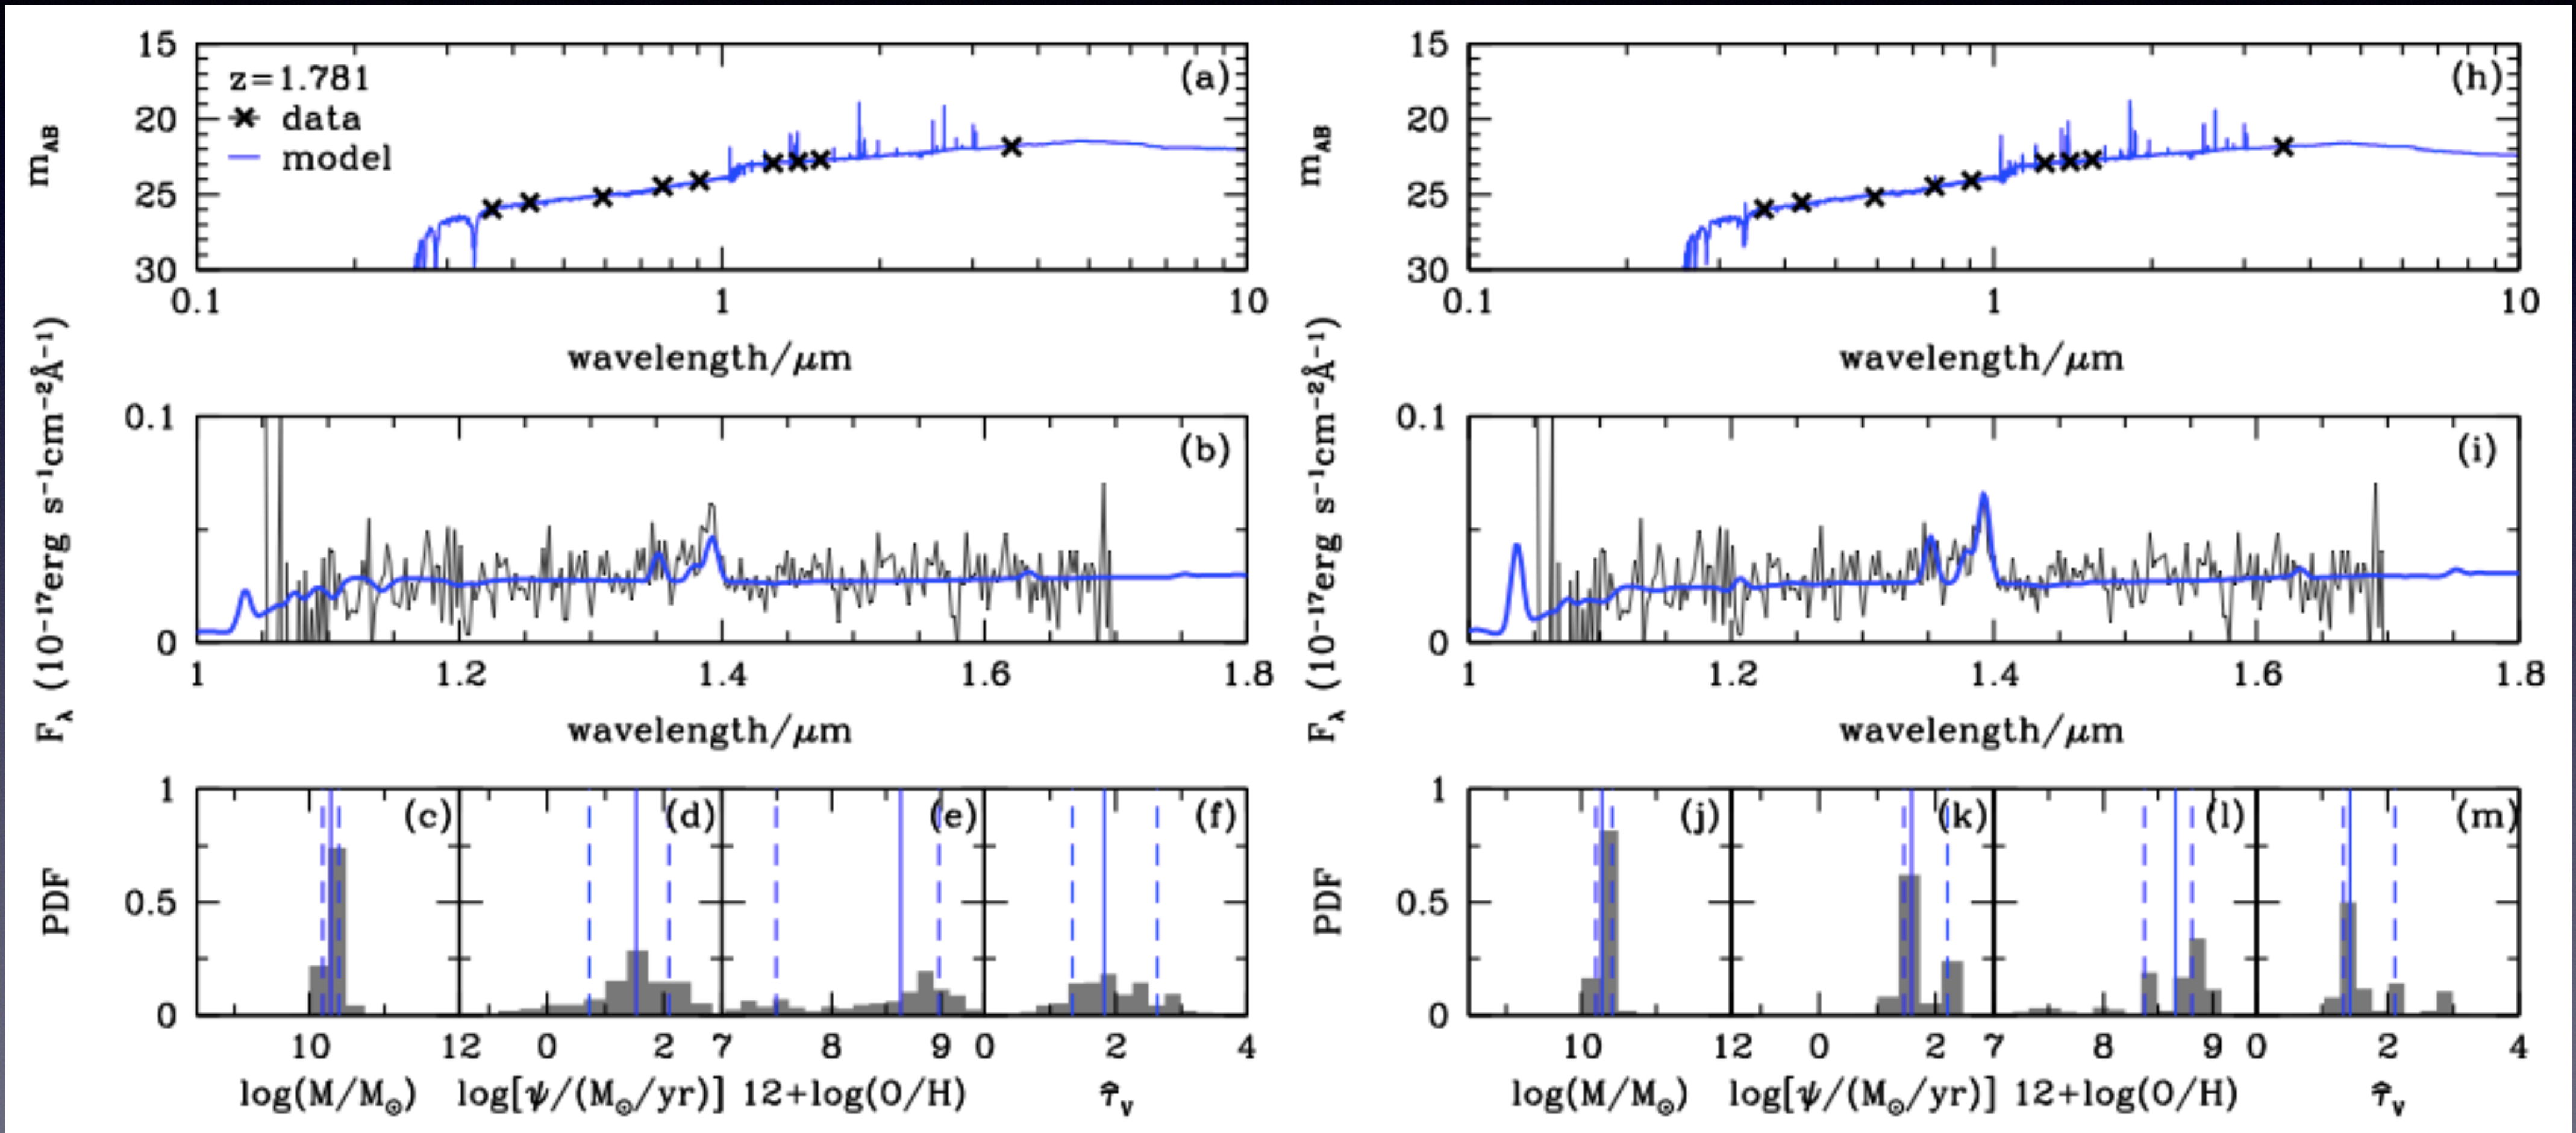

Required detection of at least **one**  
**emission line with  $S/N > 5$**

# Extracting the physical parameters

## Photometry + Spectroscopy

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

Required detection of at least **one**  
**emission line with  $S/N > 5$**

↓  
to study the effects of different SED  
libraries when extracting the  
physical parameters

↓  
9 broad bands: U, 4 ACS, 3 WFC3,  
IRAC 3.6 $\mu$ m

# Observed sample

## 3D-HST photometry and grism spectroscopy

We select galaxies in the  
**GOODS-South Field** with  
accurate grism redshifts ( $H < 23$ )

Required detection of at least **one**  
**emission line with  $S/N > 5$**

to study the effects of different SED  
libraries when extracting the  
physical parameters

to study the improvements  
given by adding spectroscopic  
information to photometry

9 broad bands: U, 4 ACS, 3 WFC3,
