Spider Time Lapse

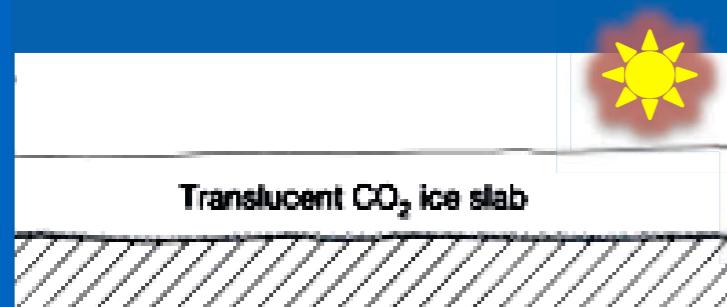

Spring

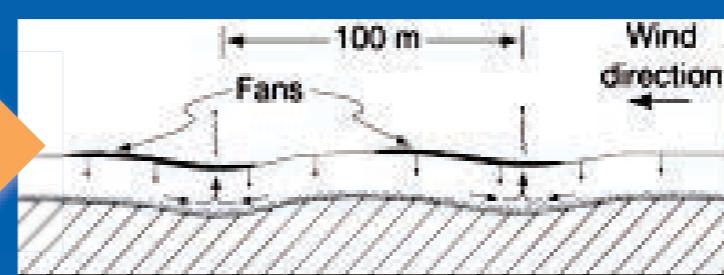

Mid Summer: No Ice Left

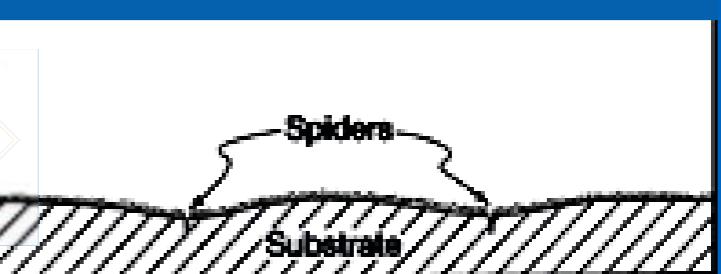

Hansen & McEwen, 2007

The Sun heats and sublimates the base of the carbon dioxide ice sheet. The carbon dioxide gas is trapped below

Kieffer et al. , 2006

Fans & blotches blend into the ground when the ice has disappeared

Carbon dioxide gas breaks out in geysers

Wind

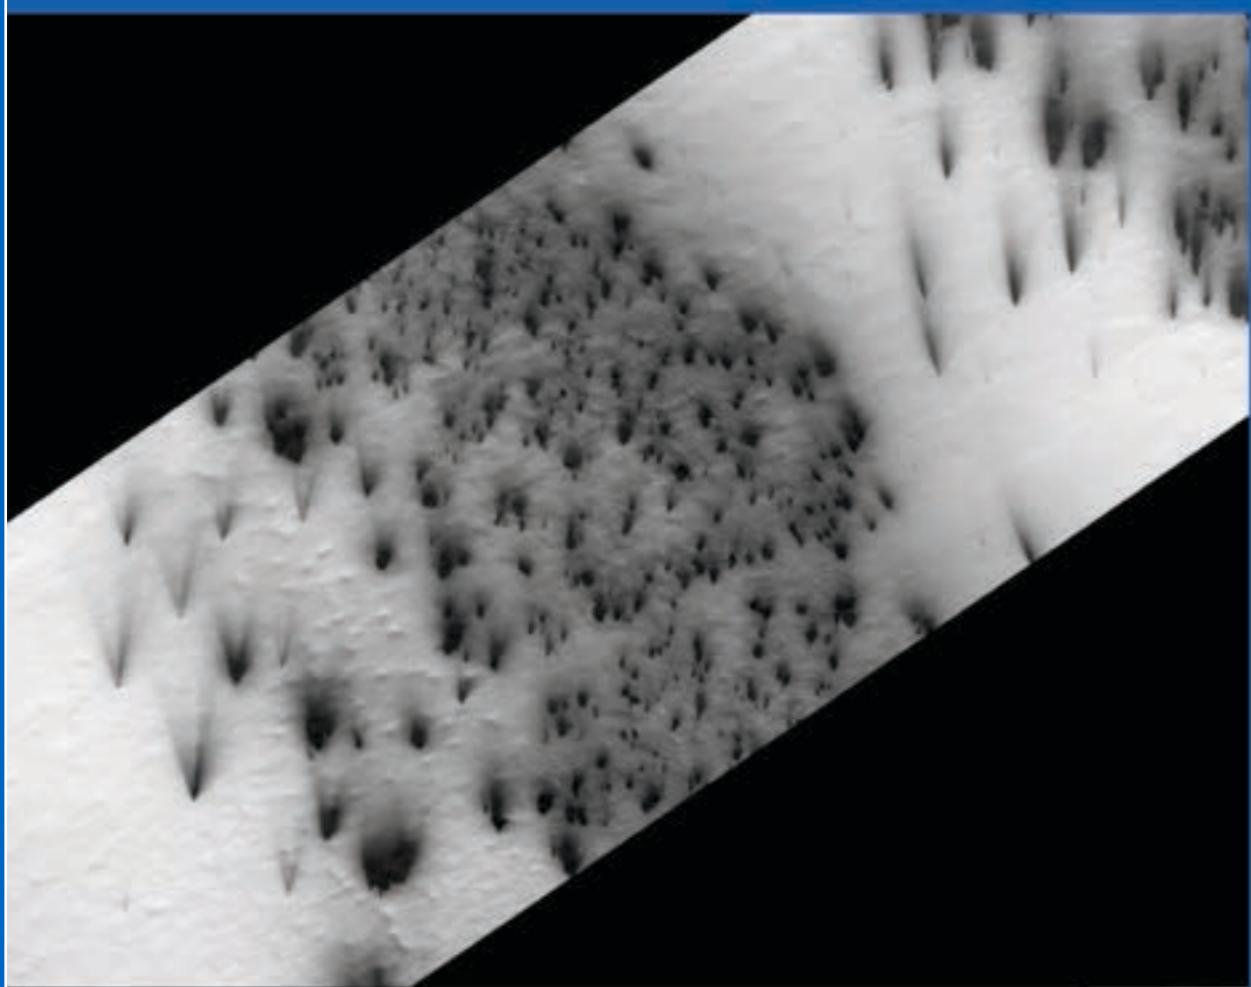

No Wind

Image credit: NASA/JPL/University of Arizona

How does the South Pole change from Winter to Winter?

Season 1

Season 2

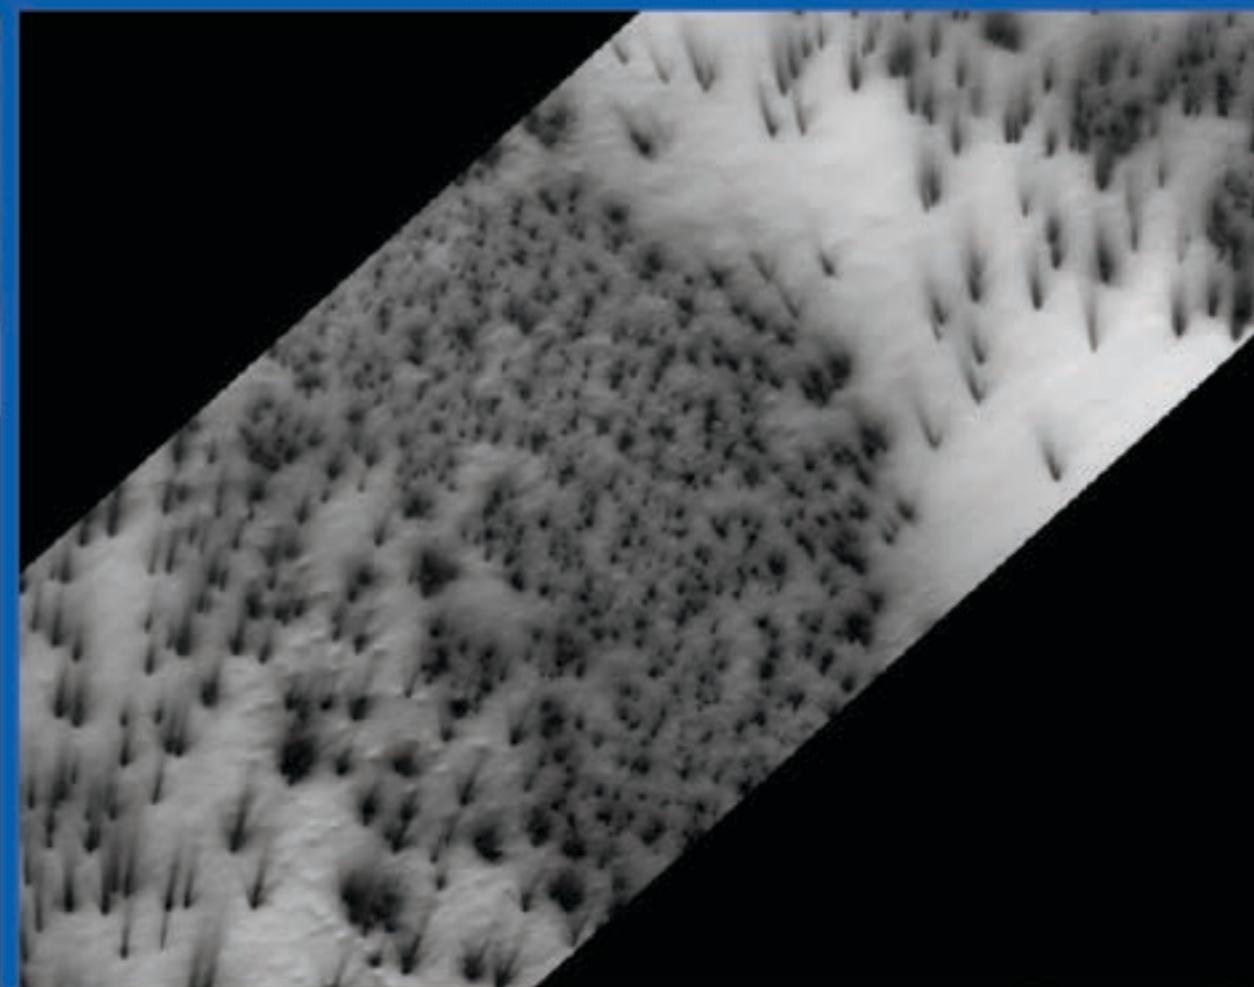

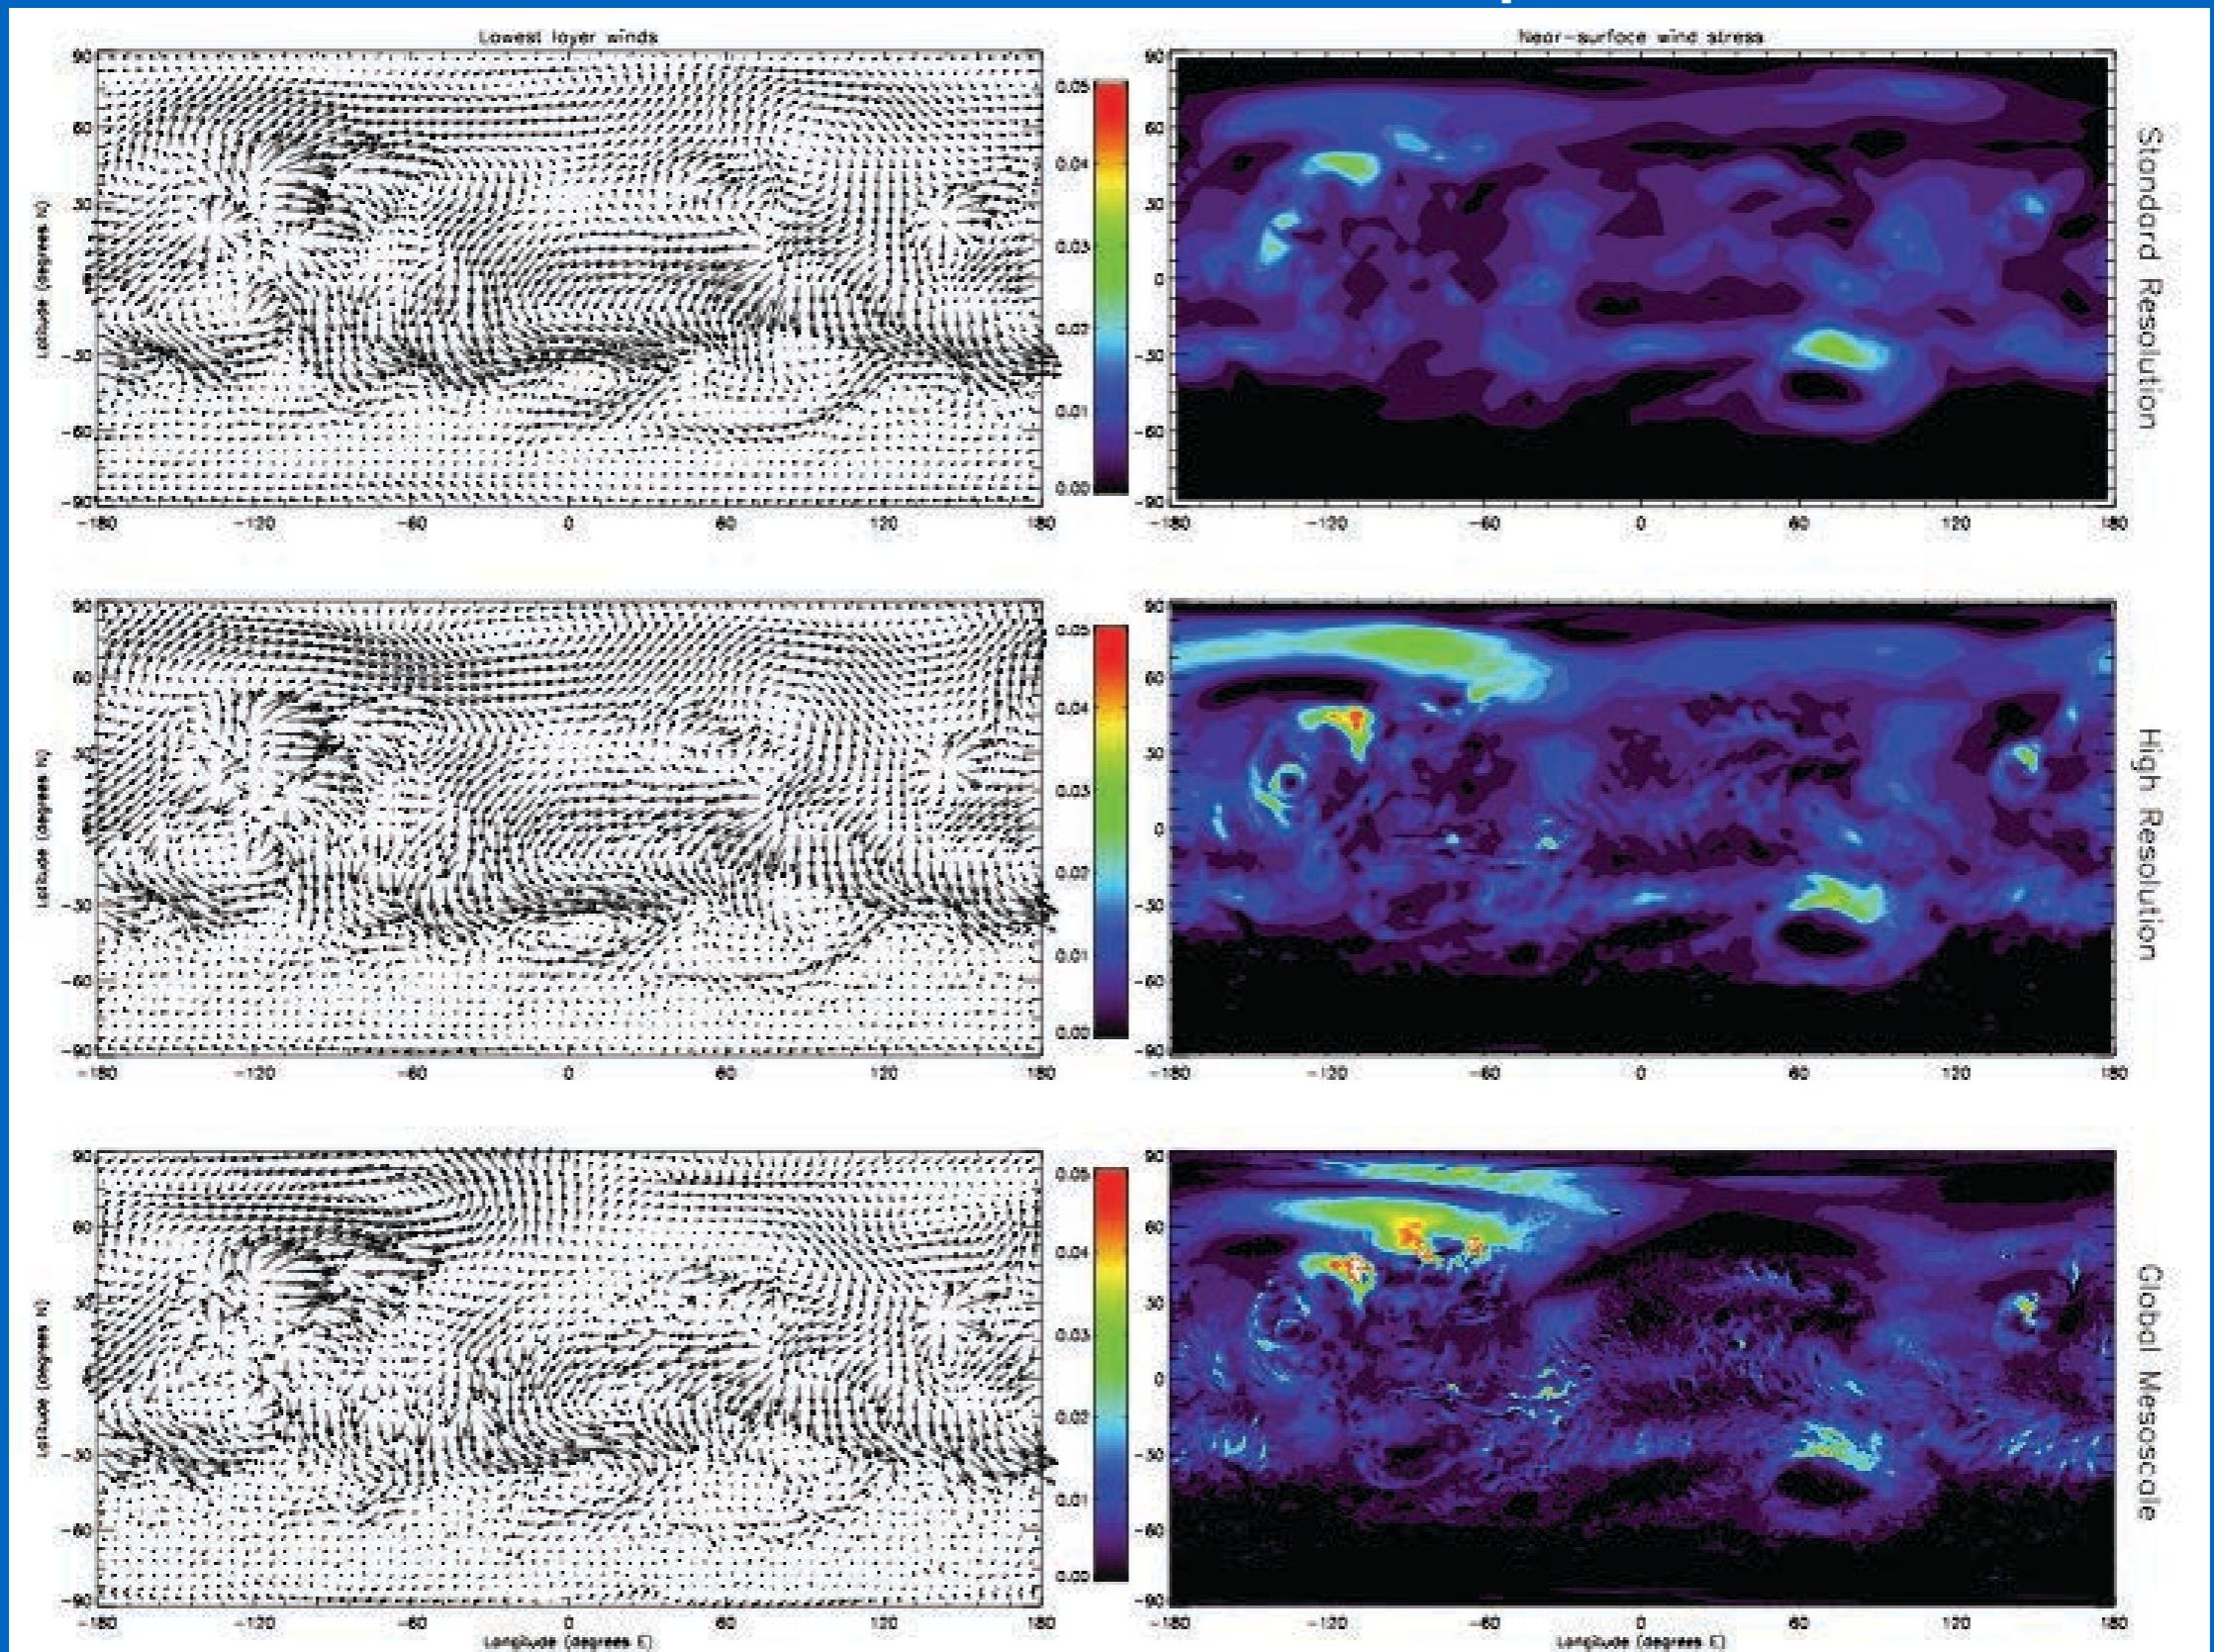

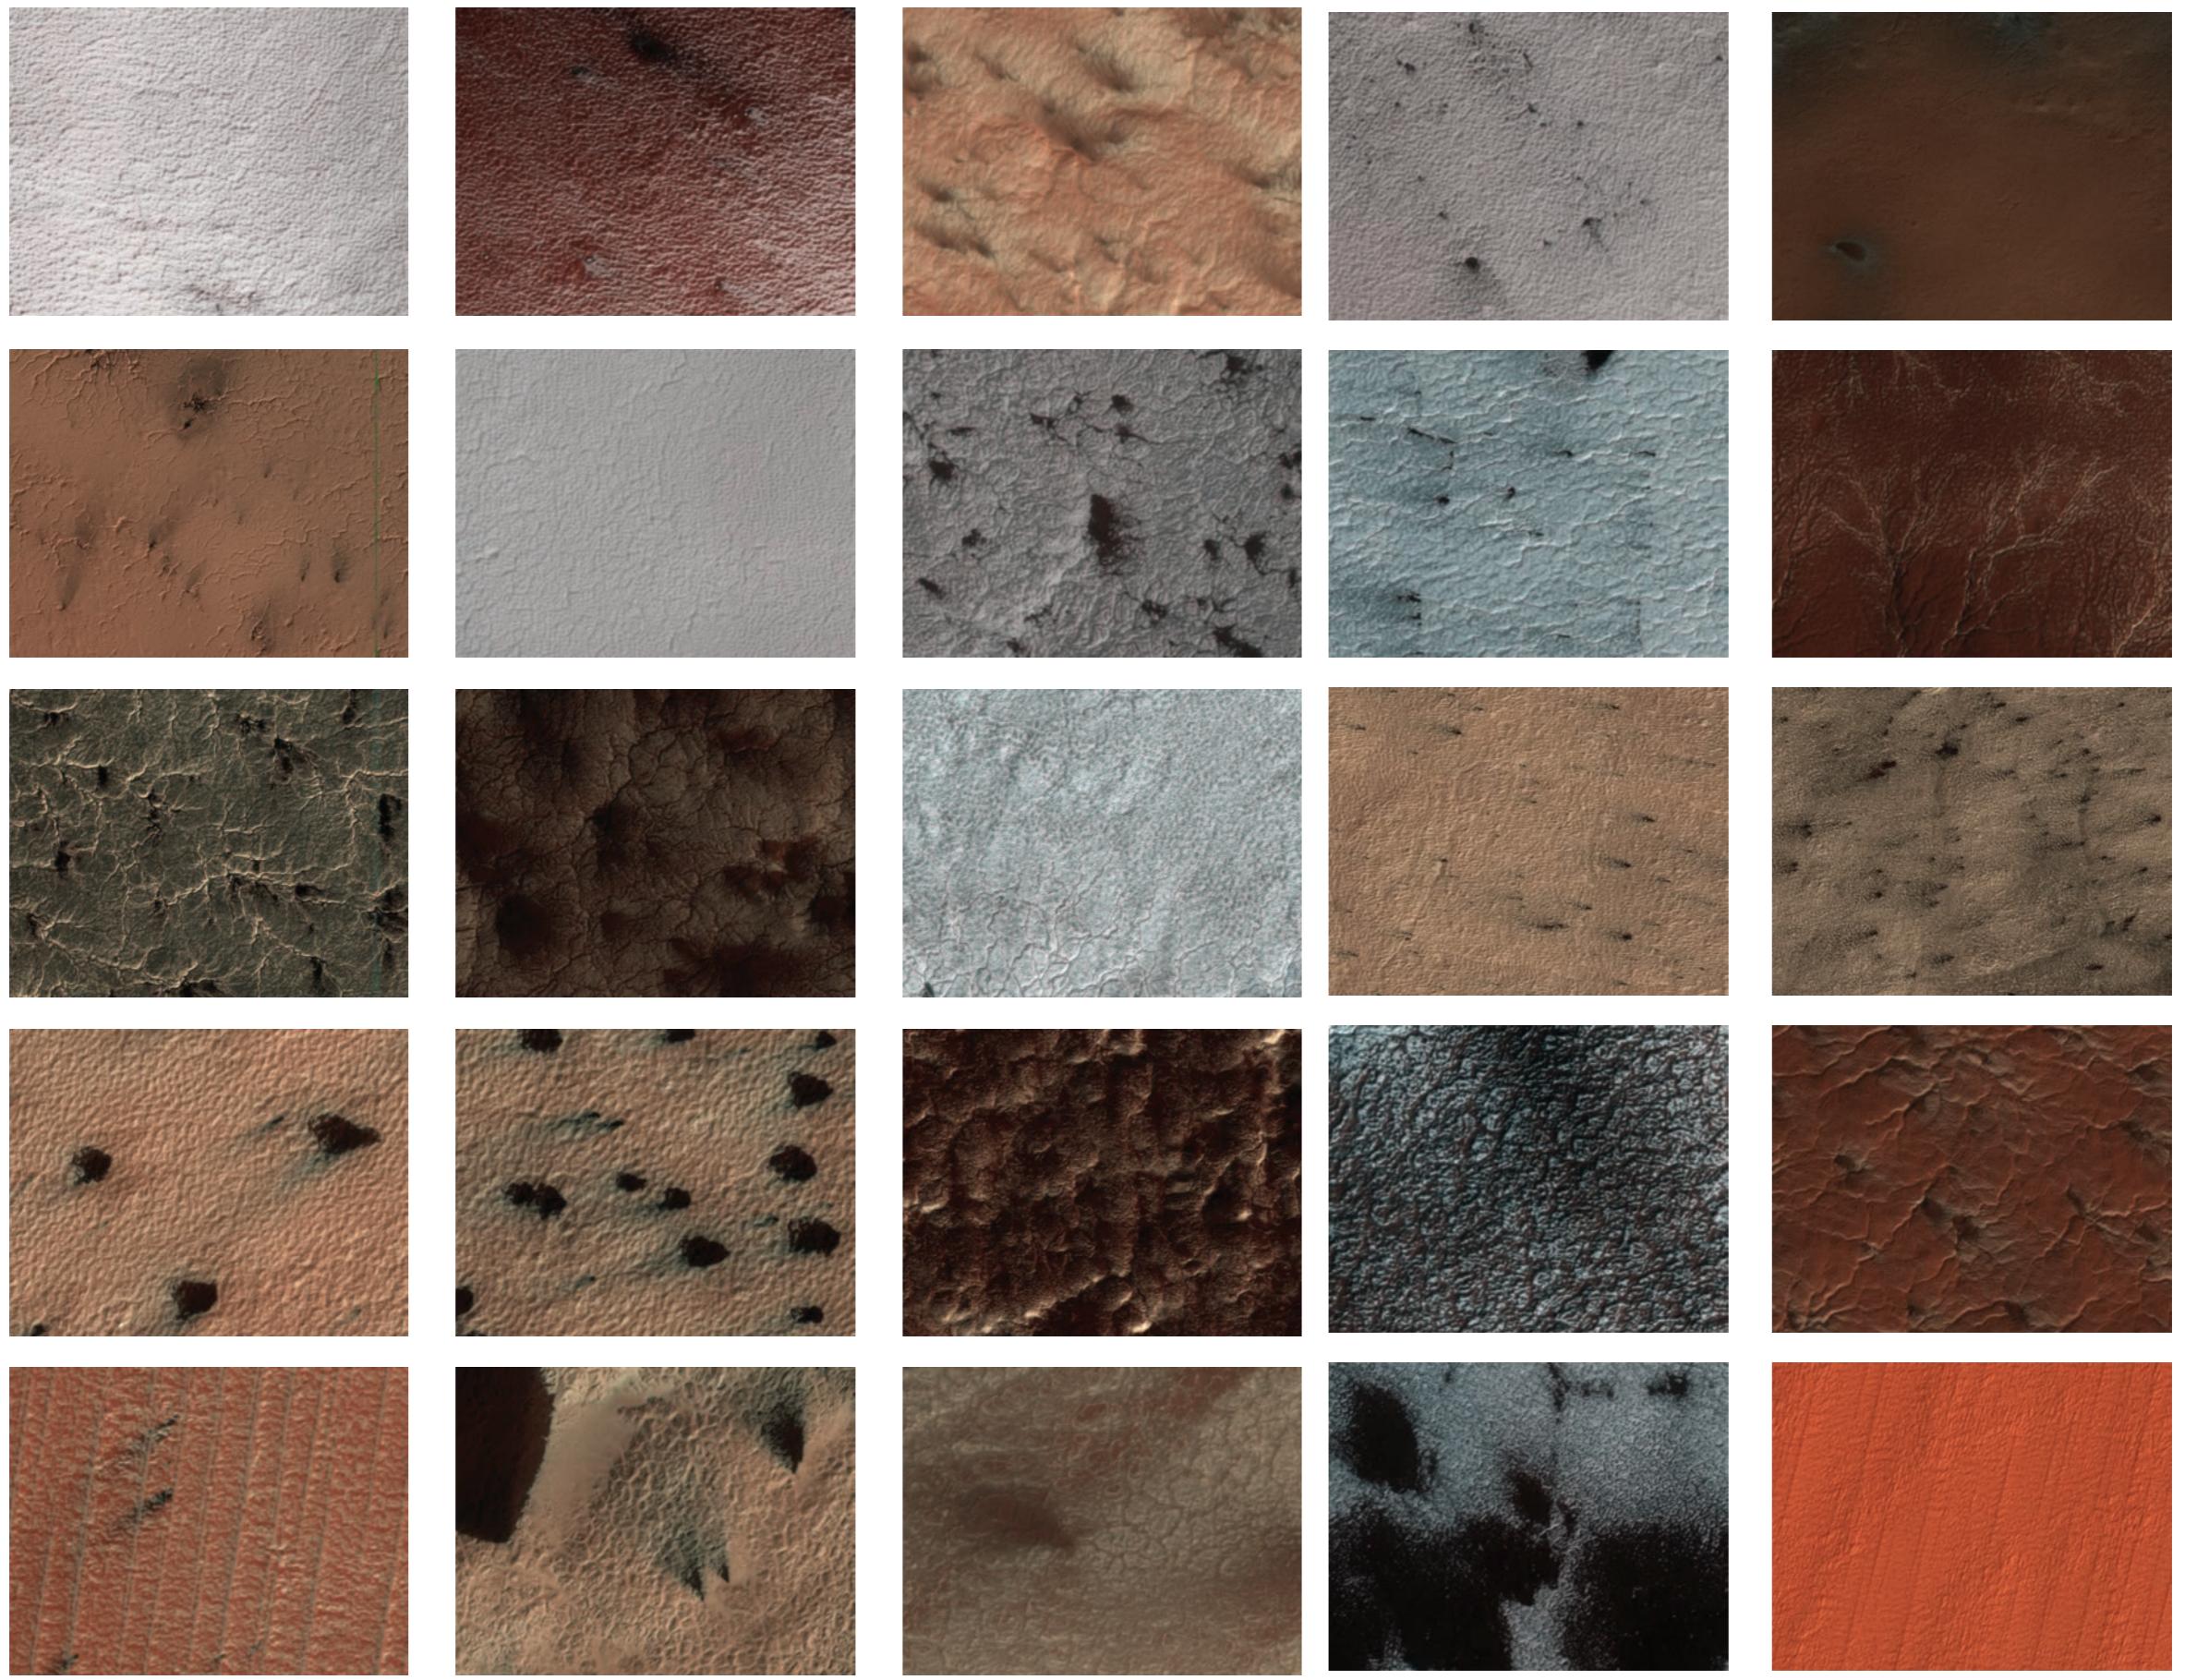

Image credit: NASA/JPL/University of Arizona

A global dust storm occurred on Mars between the two winters - how does this impact the number and size of seasonal fans and blotches?

Aim to compare to global climate models (GCMs) of wind direction and amplitude

Planet Four

122,603 volunteers have contributed in total
4,487,434 classifications since launch in January 2013

Gold Standard Data

Characterizing the Spiders....

Conclusions

- With Planet Four 122,603 volunteers have contributed in total 4,487,434 classifications since launch in January 2013
- Over 6 million markings have been made since launch
- The science team is currently working on the first catalog for Seasons 2 and 3 of the HiRISE monitoring campaign (42904 tiles, derived from 221 full-frame HiRISE images) based on Planet Four volunteer classifications
- Gold standard data is consistent with the volunteer markings
